What does this problem focus on?

Swimmers, especially beginners often feel it difficult to breathe underwater which causes breathing trouble which in turn causes a drowning

What does this occur?

Drowning happens very quickly, but it does take place in stages. The stages can take between 10 and 12 minutes before death occurs

Why do we need this?

It detects potential drownings and promptly notifies you. It features the latest artificial intelligence technology and adapts to the needs of the user.

How to do this?

Cameras detect the movements of every swimmer in the pool. The artificial intelligence of the software analyses the images acquired by the cameras in real time and identifies situations of danger or drowning

Where it is used?

In

Swimming

pools
